

## Numpy

When we deal with numeric data, the library to use is Numpy.

### → Arrays

→ `arr = np.array([1, 2, 3], dtype = np.float32)`

Int will be upcasted to float and float will be upcasted to string in the case that the array has multiple data types.

`np.int8, np.int16, int32, int64`

`float32, float64`

`np.bool`

we use the `.copy()` function since references will change original variables

→ `a = b.copy()`

get the dtype using  
→ `arr.dtype`

### Casting

`arr = arr.astype(np.float32)`

### Nan

When we don't want np array to contain a value at a particular index, we use `np.nan` as a placeholder / filler value.

→ `arr = np.array([np.nan, 1, 2])`

Note: `np.nan` cannot take an `int` dtype

→ infinity can be represented using `np.inf` & `-np.inf`  
Note: cannot take `int` as dtype

## arange

- 1 `np.arange(n)` return array `[0, n)`
- 2 `np.arange(m, n)` return array `[m, n)`
- 3 `np.arange(m, n, s)` return array `[m, n)` with step `s`

## linspace

specify number of elements in returned array

`arr = np.linspace(5, 11, num=4, endpoint=False, dtype=np.int32)`

## reshape

New shape must contain exactly all the elements from the input array.

we can use `-1` in at most one dimension

`arr = np.arange(8)`

`reshaped_arr = np.reshape(arr, (2, 4))`

## flatten

Flatten an array into 1D array

`flattened = arr.flatten()`

## transpose

`transposed = np.transpose(arr)`  
`transposed = np.transpose(arr, axes=(0,1,2))`  
axes is the permutation of dimensions

## Zeros and ones

`arr = np.zeros(4)`

`arr = np.ones((2,3))`

`arr = np.ones((2,3), dtype=np.int32)`

`arr = np.zeros_like(arr0)`

to create array with same shape as another array

`arr = np.ones_like(arr)`

## Arithmetic

`arr = np.array([[1,2,3],[4,5]])`

`arr + 1` → add 1 to each element

`arr - 1.2` → subtract each by 1.2

`arr * 2` → mul each by 2

`arr / 2`

`arr // 2` → Integer division

`arr ** 2` } pow function

`arr ** 0.5`

eg. `def farenToCel(temp):`  
`return (5/9) * (temp - 32)`

`faren = np.array([32, 4, 14])`

`celsius = farenToCel(faren)`

Note:- This creates a new array

`np.pi` →  $\pi$

`np.e` →  $e$

Other operations:-

`np.exp(arr)` →

`np.exp2(arr)` →

`np.log(arr)`

`np.log10(arr)`

`np.power(3, arr)` → raise 3 to each element in array

`np.power(arr2, arr)` → raise arr2 to power of each number in arr

## matrix multiplication

`np.matmul(mat1, mat2)`

Note → will result in `ValueError` in case of incorrect matrix dimensions

Note → Gives dot product in case of 2, 1-D arrays

## Random

`np.random.randint(5)`  $\rightarrow [0, 5)$

`np.random.randint(5, high=6)`  $\rightarrow [5, 6)$

`np.random.randint(-3, high=14, size=(2,2))`  
 $\rightarrow [[5, -3], [10, 10]]$

`np.random.seed(n)`  $\rightarrow$  set the random seed

`np.random.shuffle(arr)`  $\rightarrow$  randomly shuffle  
an array. For a matrix, only the rows  
get shuffled.

`np.random.uniform()`

`np.random.uniform(low, high, size)`

$\rightarrow$  draw sample from uniform distributions

`np.random.normal()`

`np.random.normal(loc, scale, size)`

loc  $\rightarrow$  mean

scale  $\rightarrow$  standard deviation

draw samples from normal distribution

custom sampling

`arr = [1, 2, 3]`

`np.random.choice(arr)`

`np.random.choice(arr, size)`

`np.random.choice(arr, size, p)`

$p \rightarrow$  probability for each element

## Slicing

```
arr = np.array([1, 2, 3, 4, 5])  
arr[:] → array([1, 2, 3, 4, 5])  
arr[1:] → array([2, 3, 4, 5])  
arr[2:4] → array([3, 4])  
arr[: -1] → array([1, 2, 3, 4])  
arr[-2:1] → array([4, 5])
```

we can use ~~comma~~ comma separated values  
for multi dimensional arrays.

min max  
np.argmin(arr) } get min and max values index  
np.argmax(arr) } from array

np.argmin(arr, axis)

→ axis → the dimension to run on

Note - flattens arrays by default

## Filtering

```
arr = np.array([[0, 2, 3], [1, 3, -6]])  
arr == 3  
arr > 0  
arr != 1  
~(arr != 1)
```

Note:- np.nan cannot be used

Use np.isnan to filter for location of np.nan

where

returns ~~id~~ indices of elements matching the condition.

`np.where(arr == 3)`

`x-ind, y-ind = np.where(arr != 0)`

~~positive and negative~~

True replacement values and False replacement values can be changed.

`np.where(arr, positives, negatives)`

Any and all

Any  $\rightarrow$  OR condition

All  $\rightarrow$  AND condition

`arr = np.array([-2, -1, 3])`

`np.any(arr > 0)  $\Rightarrow$  True`

`np.all(arr > 0)  $\Rightarrow$  False`

axis param can be passed like in `argmin` and `argmax`

`np.any(arr > 0, axis = 0)  $\Rightarrow$  rows`

`np.any(arr > 0, axis = 1)  $\Rightarrow$  columns`

Output is now an array

## Statistics in NumPy

### min & max

`arr.min()` → Returns least element

`arr.max()` → returns greatest element

axis can be passed; output will now be an array.

- `np.mean(arr)`
  - `np.median(arr)`
  - `np.var(arr)` ⇒ variance.
- } also take axis

### Aggregation

`np.sum(arr)`

axis parameter can be passed

Note will return a flattened array.

`np.cumsum(arr)` → cumulative sum

`np.concatenate([arr1, arr2])`

axis param can be passed, default = 0  
and concatenates vertically

### Saving data

`np.save('<filename>.npz', arr)`

Note - will overwrite file with same name

Note - .npz will get appended if not in name

### Loading

`arr = np.load('arr.npz')`

Note: - will NOT auto-append .npz
